Laser Displacement Sensor

MLD21 Series ▶

CMOS sensor element Highly accurate detection achieved by triangulation principle

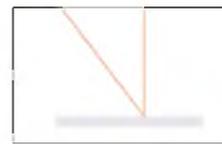

By triangulation principle, the incoming light port on the CMOS of the sensor receiver moves as the object position changes.

And the change of objects can be checked by detecting the incoming light position.

Automatic Exposure Adjustment

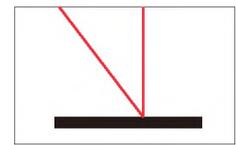

The amount of energy received can be automatically adjusted according to different applications;

Detection remains stable even the color or material of the workpiece changes.

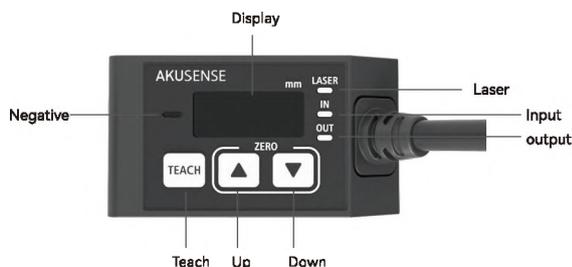

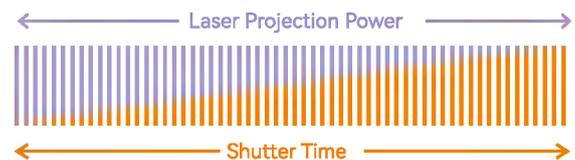

Measuring brighter objects

Laser Weakened

Measuring darker objects

Laser Enhanced

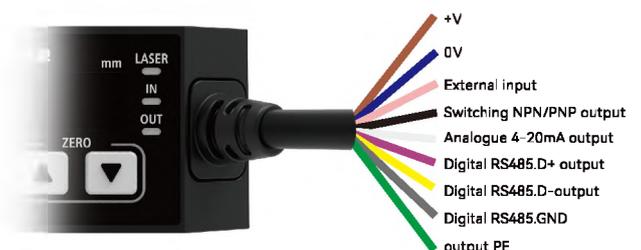

Intuitive digit display on the panel, and button function makes commissioning easy

Equipped with display and function buttons within a mini space;

The opening/closing of the laser, external trigger signal and control output signal status can be intuitively presented; most function settings can be made directly via the sensor panel.

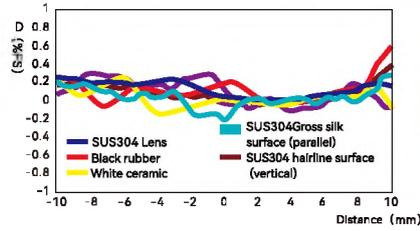

It includes parameter item setting, function item setting and threshold setting.

Integrated output methods; Switching, analogue and digital outputs all in one.

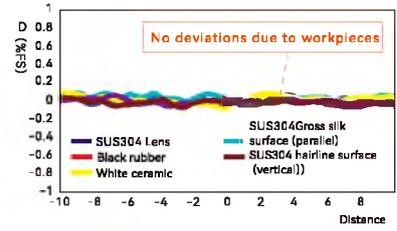

Detection remains stable even the workpiece moves

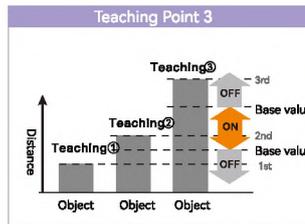

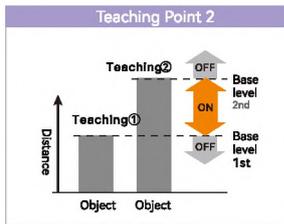

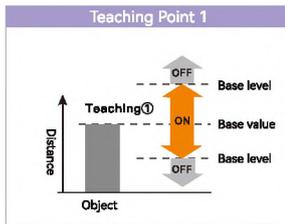

For workpieces with rough surfaces, a linear beam is used to average the amount of reflection. And the amount of light received is corrected at a highspeed of 30us for per measurement cycle to reduce the alteration of the amount of light received caused by workpiece moving. Thus the detection remains stable even when the workpiece is displaced during the pro process of measurement.

Material-based linear properties of MLD21

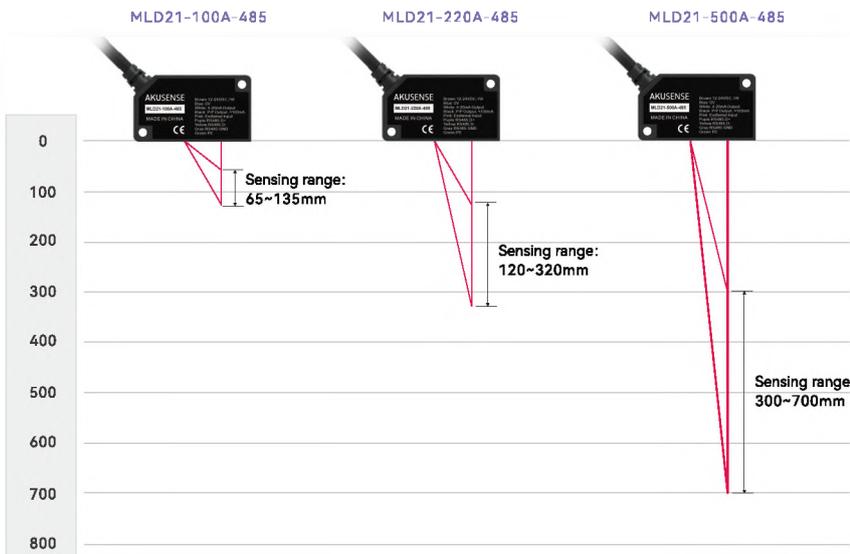

Built-in rich detection mode for greater functionality

In addition to the basic teaching settings, the following three modes have been implement Basic teaching mode for simple setting of the presence or absence of the object to be mea A single-point serial comparison mode for deviat from the reference measurement surface; A two-point teaching serial comparison mode fo precise range control.

Mini Chinese Display

More Intuitive and Simple for Commissioning

Convergent harnesses for more accurate detection

AkuseNSE has developed its own optical system to significantly converge and improve the beam to 50um; An ultra-small spot size of 0.05mm formed, which detects objects with stability and accuracy.

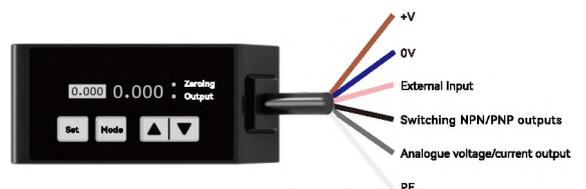

Micron-level linear accuracy

Linear accuracy reaches to 0.01mm for easy inspection with high accuracy

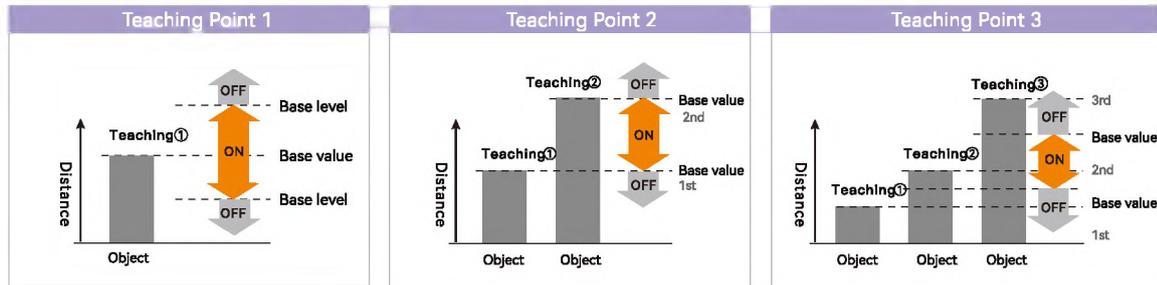

Convenient Installation

Integration of analogue voltage, analogue current and switching

Simple and flexible test patterns

Multiple teaching modes to make testing easier

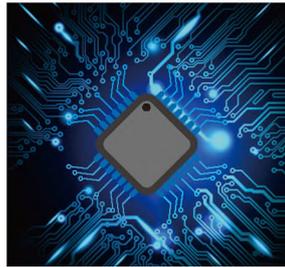

Faster, more stable, more accurate

Three test modes are for option: standard, high speed and high accuracy

① Ultra-high speed computing and processing

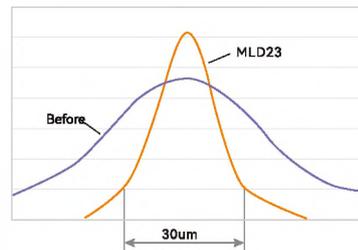

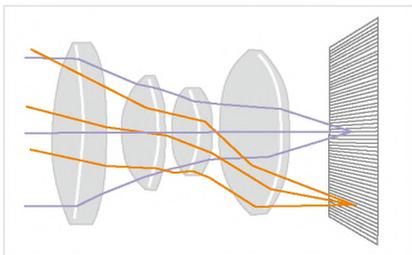

The application of Akusense's advanced IC and algorithm technology has greatly improved the sensor's detection rate and data accuracy, allowing for both high speed transmission and stable detection of measured values.

Max 1.5ms response time

Repeat accuracy up to 10um

Min ±0.1% F.S linearity

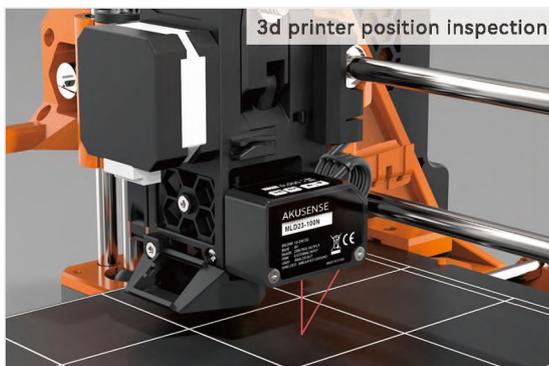

② Achieving greater precision

The new Akusense high-resolution lens design reduces pixel aberration and is assembled with precision.

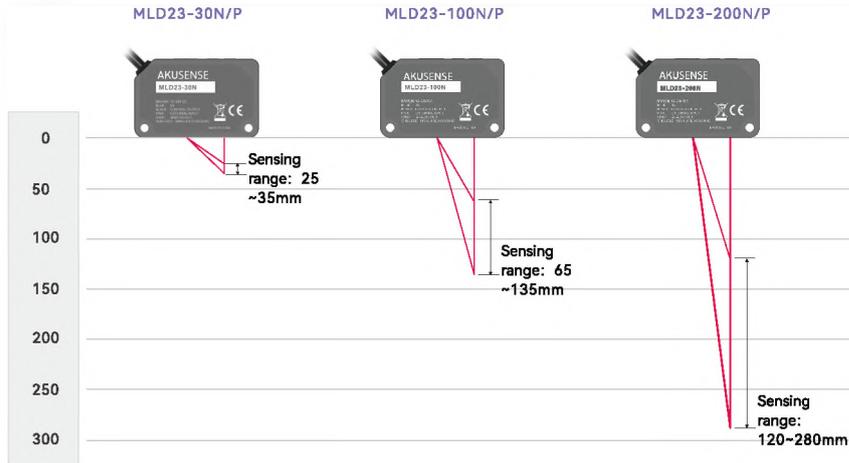

The small spot of light at any angle can be imaged at the receiving section, resulting in a smaller waveform and higher measurement accuracy.
